

CA-Software Assignment-1

Serverless Architecture:

Serverless allows developers to run code without managing servers, reducing operational overhead and scaling automatically. It suits applications with unpredictable traffic and lowers costs for infrequent workloads.

Progressive Web Apps (PWAs):

PWAs offer web applications that behave like native apps, with offline capabilities, push notifications, and responsive design. They provide a seamless experience across devices without installation.

AI and Machine Learning in Software Architecture:

AI/ML improves personalization, recommendation systems, fraud detection, and automation. They shape modern software architecture by enabling intelligent decision-making at scale.

Cloud Computing Models:

SaaS (Software as a Service): Complete apps hosted online (e.g., Gmail, Salesforce).

PaaS (Platform as a Service): Provides environment for development (e.g., Google App Engine).

IaaS (Infrastructure as a Service): Offers virtual machines and storage (e.g., AWS EC2). Each model supports different use cases, from full applications to infrastructure provisioning.
